EVALUATE EXPRESSION THAT TAKES DIGITS, *, + USING LEX AND YACC

AIM:

To perform arithmetic operations that takes digits,*, + using lex and yacc.

ALGORITHM:

Lex (**exp7.l**):

- 1. Recognizes sequences of digits and returns the token NUMBER.
- 2. Ignores tabs and newlines.
- 3. Returns any other single character as itself.
- 4. Indicates the end of input with yywrap().

Yacc (exp7.y):

- 1. Includes headers and declares global variables.
- 2. Declares token NUMBER.
- 3. Defines operator precedence and associativity.
- 4. Defines grammar rules for arithmetic expressions.
- 5. Prints the result of the expression evaluation in the ArithmeticExpression rule.
- 6. Handles syntax errors with yyerror().
- 7. The main function, prompts for an arithmetic expression, parses it, and prints whether it's valid or not based on the presence of syntax errors.

PROGRAM:

exp7.l:
